(a)
model, $\zeta_1 = 0.25$
Compustat slope 0.20
$E[v \mid \bar{S}]$
life-mean size $\bar{S}$
(b)
model (7 economies)
Compustat
$\zeta_q = q\zeta_1$
ζ_q/ζ_1
q
(c)
Compustat tail, $b = 4.6$
smallest fifth
largest fifth
complementary CDF
$v/E[v \mid \bar{S}]$
